

POLARITY IQ

DIFFERENTIATOR ASSESSMENT

Stage 1

Test Disclaimer: All work submitted as part of this evaluation remains the sole intellectual property of the candidate. Falcon Scaling and PolarityIQ make no claim of ownership over any datasets, code, tools, pipelines, products, or analyses created during this testing process. Your work is yours, regardless of the outcome.

Instructions

This first stage contains two tasks. You have 48 hours from the time you receive this document to complete these tasks.

You are expected to use AI tools, but your thinking must exist independently and be visible in your work.

We will evaluate how you form beliefs, what you are uncertain about, how you validate assumptions and conclusions, how you categorize speculation, inferences, and facts, and how you make decisions.

If your submission reads as fully structured and polished AI output with no clear human-level reasoning, uncertainty, or validation, it will not be evaluated.

In order to evaluate your submission, we need to see how you build as well as how you think.

We will only be able to offer individualized feedback on a submission that contains evidence of the reasoning behind it.

Please review this document closely, before starting your assessment:

[How We Work](#)

Task 1: Family Office Dataset + RAG Pipeline

Build a validated dataset of 50 real family office records. Then build a RAG pipeline that ingests your dataset and makes it queryable via natural language.

What is a Family Office (FO)? A family office is a private, dedicated entity established by ultra-high-net-worth families to manage their wealth, investments, taxes, philanthropy, and legal affairs. They provide tailored, comprehensive financial and non-financial services exclusively for one family (Single-Family Office) or a small number of families (Multi-Family Office).

Here is an example of a family office dataset for reference:

<https://app.box.com/s/mde9a55o79dl7e5ts4ftn3bbjsy6khdd>

This dataset sample is provided to illustrate one possible approach to schema design and data layering. Your dataset must contain entirely original records sourced through your own work.

What Might a High Value Family Office Dataset Contain:

- Family Office Principal contact information (Linkedin addresses, email, phone)
- Signals (recent investments, fund commitments, key hires)

These field suggestions are just that, suggestions. You are free to choose schema categories that maximize the value of your output file.

Deliverables:

- A structured dataset file (CSV or XLSX) containing 50 validated Family Office records.
- A methodology summary covering: how you found them, how you enriched them, how you validated them, what you would improve.
- Select 3 records and provide a full validation chain: discovery source, extraction method, enrichment steps, validation logic, confidence assessment, and exact sources or links used.
- A working GitHub repository containing your full RAG pipeline.
- A live URL or screen recording demonstrating real queries returning real results from your dataset.
- A brief documentation note covering: stack choices, chunking strategy, embedding model, retrieval approach, what works, what does not, and what you would improve.

Task 1 End

Task 2: SaaS Conversion Analysis

A SaaS platform focused on providing Family Office Intelligence to a targeted audience is only converting 3% of free accounts to paying users. The SaaS platform founders want to increase MRR. To that end, how would you improve this free trial to paid conversion rate?

Task 2 End

Final Deliverables

Send all deliverables to optimize@falconsaling.com within 48 hours of receiving this document.

Include everything in a single email. Request verification that your materials were received.

Time + Effort Reporting

Include with your submission a report covering each task:

- Total hours spent.
- How that time was allocated (research, building, writing, testing, reviewing).
- Which parts involved AI and which parts were your own work.
